Password Requirements

The CalLutheran.edu website hosts content for a range of different target audiences. Although most content is intended for *prospective students and families* and is therefore available to the public, you may find an occasional need to host content that restricts access to specific audiences.

If you would like to restrict a page or section of pages to require a password, this can be added. Options exist to set access using Single-Sign On (SSO) through a MyCLU login or using a Custom Password.

How to Add a Single-Sign On (SSO) Requirement

Single-Sign On (SSO) can restrict access via a MyCLU login to one or more of the following groups, as seen in the example below:

- *Faculty/staff*
- *Regents*
- *Students*
- *Alumni*

If you would like to add a Single-Sign On (SSO) requirement to a page or section of pages, please Contact Us with the details of your request.

 PRO TIP: For **Global Admin** users who are adding the Single-Sign On (SSO) feature via Source Code...

- For current *faculty/staff/regents/students/alumni*, insert **<prepend>{{a:81}} </prepend>** before the tags for **<headcode></headcode>**
- For current *faculty/staff/regents*, insert **<prepend>{{a:943}}</prepend>** before the tags for **<headcode></headcode>**
- For current *faculty/staff/students*, insert **<prepend>{{a:944}}</prepend>** before the tags for **<headcode></headcode>**
- For current *faculty/staff*, insert **<prepend>{{a:795}}</prepend>** before the tags for **<headcode></headcode>**
- Other configurations of groups may be available upon request

Once the proper Single-Sign On (SSO) feature is inserted into the **<headcode></headcode>** tags, it is also possible to autofill the **Name**, **Student ID**, and **Email** fields on a page with an embedded WuFoo form. To do this, copy/paste following text into the Source Code within the Javascript embed code for the WuFoo form on the page (insert this code after the **'height'** variable and before the **'async'** variable):

- 'defaultValues':'field1=<?php echo $user['firstname']; ?>&field2=<?php echo $user['lastname'];

```
?>&amp;field3=<?php echo $id; ?>&amp;field4=<?php echo $user['email']; ?>',
```

After copy/pasting the above Source Code, edit the number of each field in the Source Code to match the **Field ID** within the WuFoo form (inspect Frame Source in web browser to see **Field ID** numbers).

How to Add a Custom Password Requirement

Custom Password can restrict access to the following audiences, as seen in the example below:

- *Custom group (password is provided to group members)*

If you would like to add a Custom Password requirement to a page or section of pages, please Contact Us with the details of your request.

   PRO TIP: For **Global Admin** users who are adding the Custom Password feature via Source Code...

- See notes for details.
